My Manual Testing Plan: Swag Labs Storefront Review

1. What Features I Am Testing (Scope)

For this project, I am map-checking the main parts of the Swag Labs online store to ensure a regular shopper can complete an order smoothly. I am focusing on:

The Login Screen: Making sure users can get into their accounts with their passwords.

Product Browsing: Checking how the items, photos, and descriptions look on the main page.

The Shopping Cart: Verifying that adding, removing, and holding items works correctly.

The Checkout Pages: Testing the forms where users fill out their delivery details to finish a purchase.

2. How I Am Testing It (Types of Testing)

Standard Paths (Functional): Doing regular, everyday user steps to ensure the website processes sales cleanly.

Layout Scans (UI/Visual): Looking closely at the screen to spot missing graphics, weird button alignments, or text display errors.

Trying to Force Errors (Negative Testing): Logging in with locked or invalid profiles on purpose to see if the system blocks them safely with a clear warning.

Boundary Checks (Edge Cases): Testing the text fields to see what happens if someone types empty spaces or leaves mandatory info blank.

3. Setup Details (Test Environment)

Website Link: https://saucedemo.com

Browsers Used: Google Chrome (Latest Version).

Local Machines: Running live checks on standard desktop setups (Windows).

4. Accounts Used (Test Data)

I executed my manual testing matrix using the specific user profiles provided by the platform:

standard_user (Used for testing the clean, bug-free checkout flow)

locked_out_user (Used to verify that blocked accounts are restricted correctly)

problem_user (Used to run visual regressions and check form field limitations)

performance_glitch_user (Used to check for server responses and screen loading times)

error_user (Used to intentionally trigger application runtime breaks and validation failures)

visual_user (Used to isolate hidden graphic alignment anomalies and layout spacing breaks)

5. My Detailed Test Suite (Test Cases)

Excel Sheet

6. High-Risk Areas (Risk Assessment)

The Checkout Form Fields: The user is able to make a purchase even without entering any valid data.

Product Grid Image Assets: Broken item image thumbnails are a secondary risk flag. When item graphics load incorrectly, it lowers consumer buying confidence, which causes people to leave the site without purchasing.
